

Tooth Coloured Fillings

818 Dental is an amalgam free practice. We endeavor to use only the most technologically advanced tooth coloured filling materials.

In restorative cases we most commonly recommend the use of composite resin. Composite resin doesn't contain any mercury or other metals and is more biocompatible with natural tooth structure.

Unlike old amalgam fillings which must be held in place by creating a mechanical lock in the surface, composite resin is bonded to the tooth. Consequently less tooth structure must be sacrificed when using composite resin filling material.

Composite resin is available in a variety of different shades and can be matched to the colour of your existing tooth.

We use an LED curing light which ensures these materials are 100% set when you leave our office.
